

Instructions for File Import and File Export between USB and VTL30

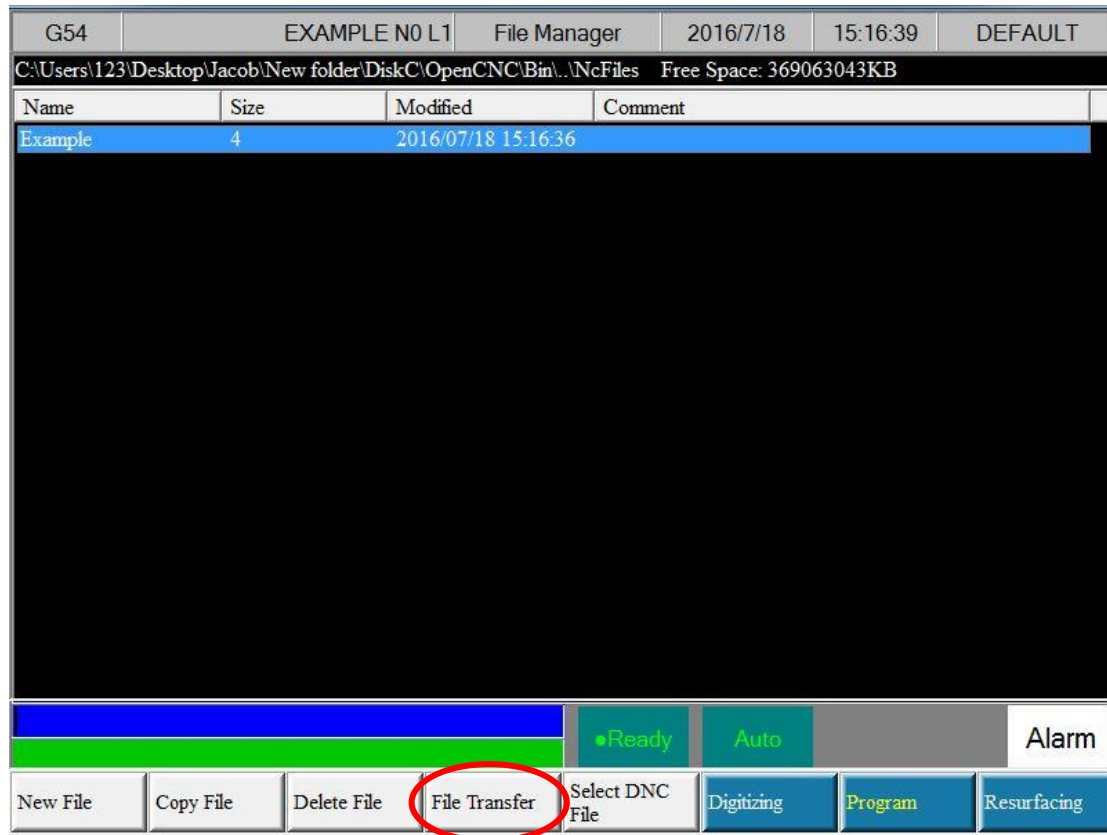

Step 1: Connect the USB into the machine's USB ports and click on the "Program" button

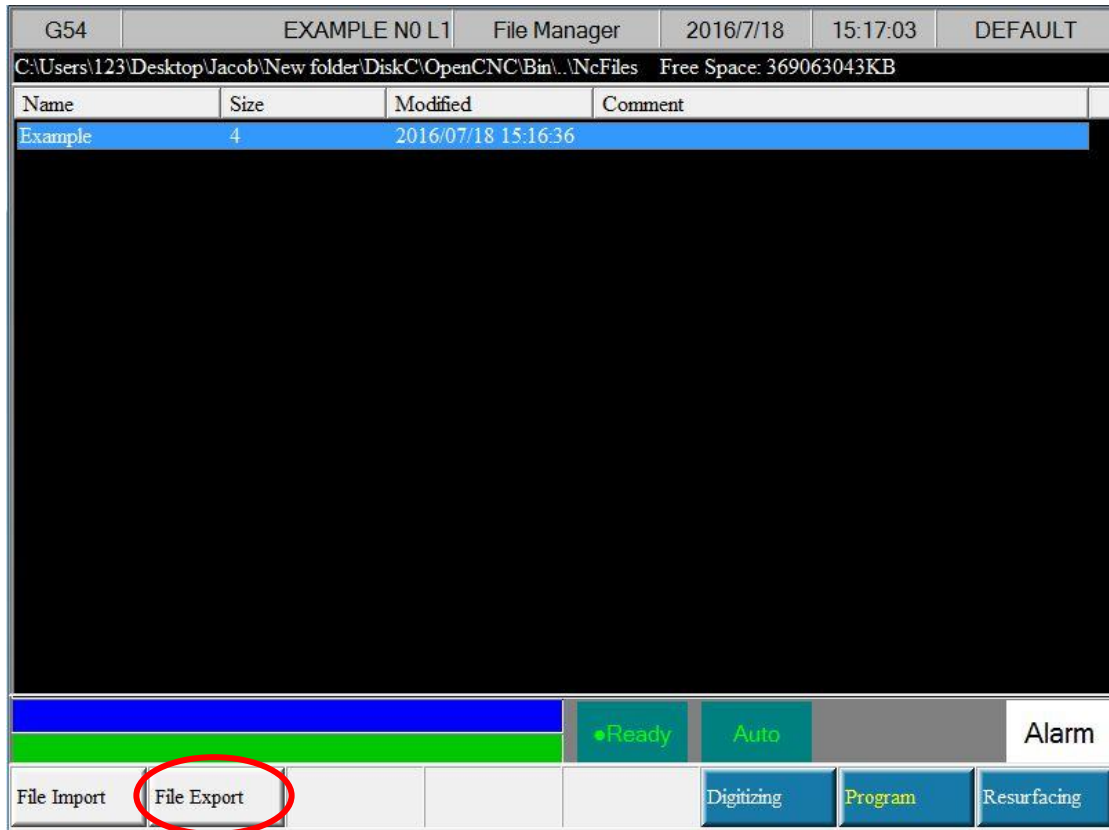

Step 2: Once inside of the "Program" menu enter the "File Manager" menu by clicking the "File Manager" button.

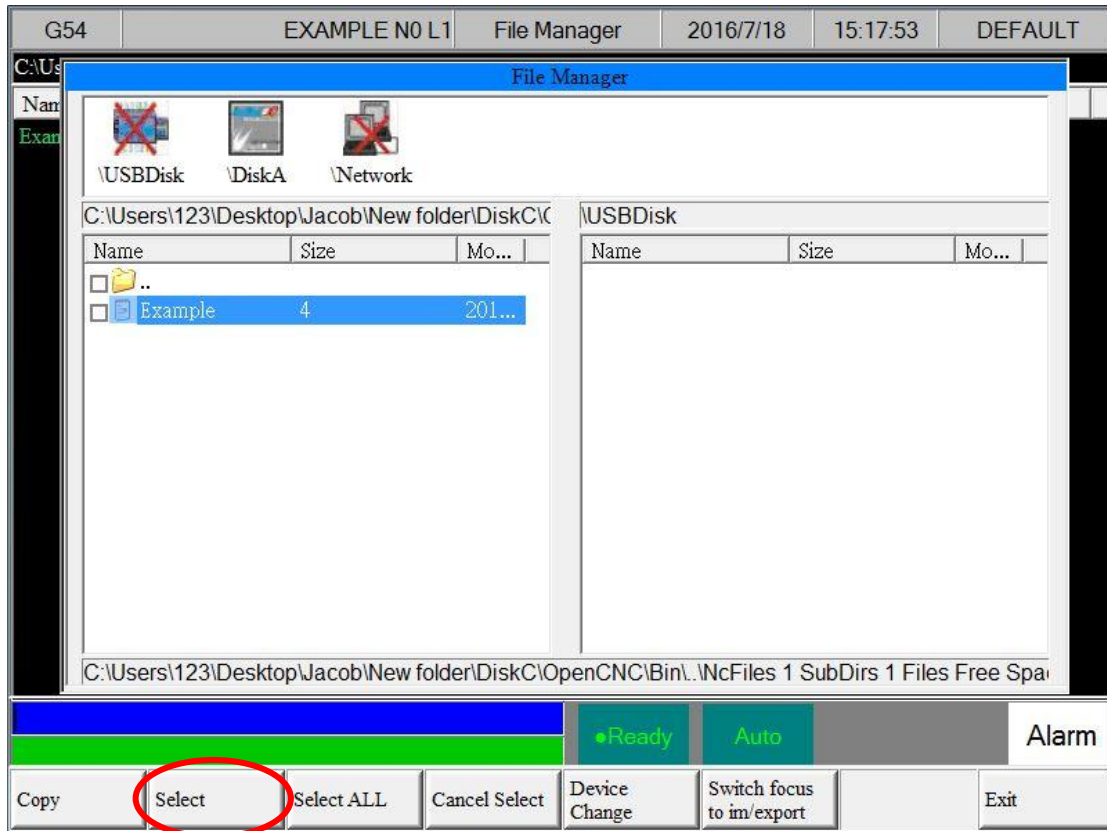

Step 3: Inside the "File Manager" menu you should be able to see all the files hosted in the machine. In this tutorial, you can see the file labeled "Example" which has been highlighted. After entering this menu click on the "File Transfer" button.

Step 4: After clicking on the "File Transfer" button you will be prompted with one of two options. "File Import" is used to send files from a USB into the machine. "File export" is used to send files from the machine to the USB. In this example we will be doing a file export.

Step 5: After clicking the "File Export" button this is what you should see on your screen. To select the specific file you want to export into your USB you must use the arrow keys to highlight the correct file and then press "Select"

Step 6: After you have selected the specific file that is being exported press the "Copy" button. As you can see, the "Example" file has been successfully moved into the USB. In order to move a file from a USB into the machine, press "File Import" at step 4 instead of "File Export" and follow the same steps.
